## Presentation Outline

- ② Introduction
- ② Analysis Of Different GIS Waste Management Models
- ② A Specific Integrated GIS Waste Assessment Model
- ② Basic Equations Governing The Software Model
- ② Application Of Model
- ② Economic viability of treatment technologies for Indian cities
- ② Landfill Sites Selection and Location
- ② Convergence with GIS
- ② Concept Of GIS Based Decision Support System.
- ② Conclusion

# ANALYSIS OF DIFFERENT WASTE MANAGEMENT MODELS

Integer Linear Programming Model

# **HOW IT IS DIFFERENT FROM DEVELOPED COUNTRIES:**

- ✓ **A high organic content**
- ✓ **Poor performance of the formal sector**
  - ✓ **Extensive informal activities**
- ✓ **Low per capita levels, high aggregate levels**
- ✓ **Cost of GIS models and Products**

# Research Problem

- ② Landfill site selection and location
- ② Analysis of existing GIS models
- ② Open Source Software
  - Does not take typical developing countries perspective
  - Not as advanced as commercial software
  - Free of Cost
  - Source Code available, can be customized

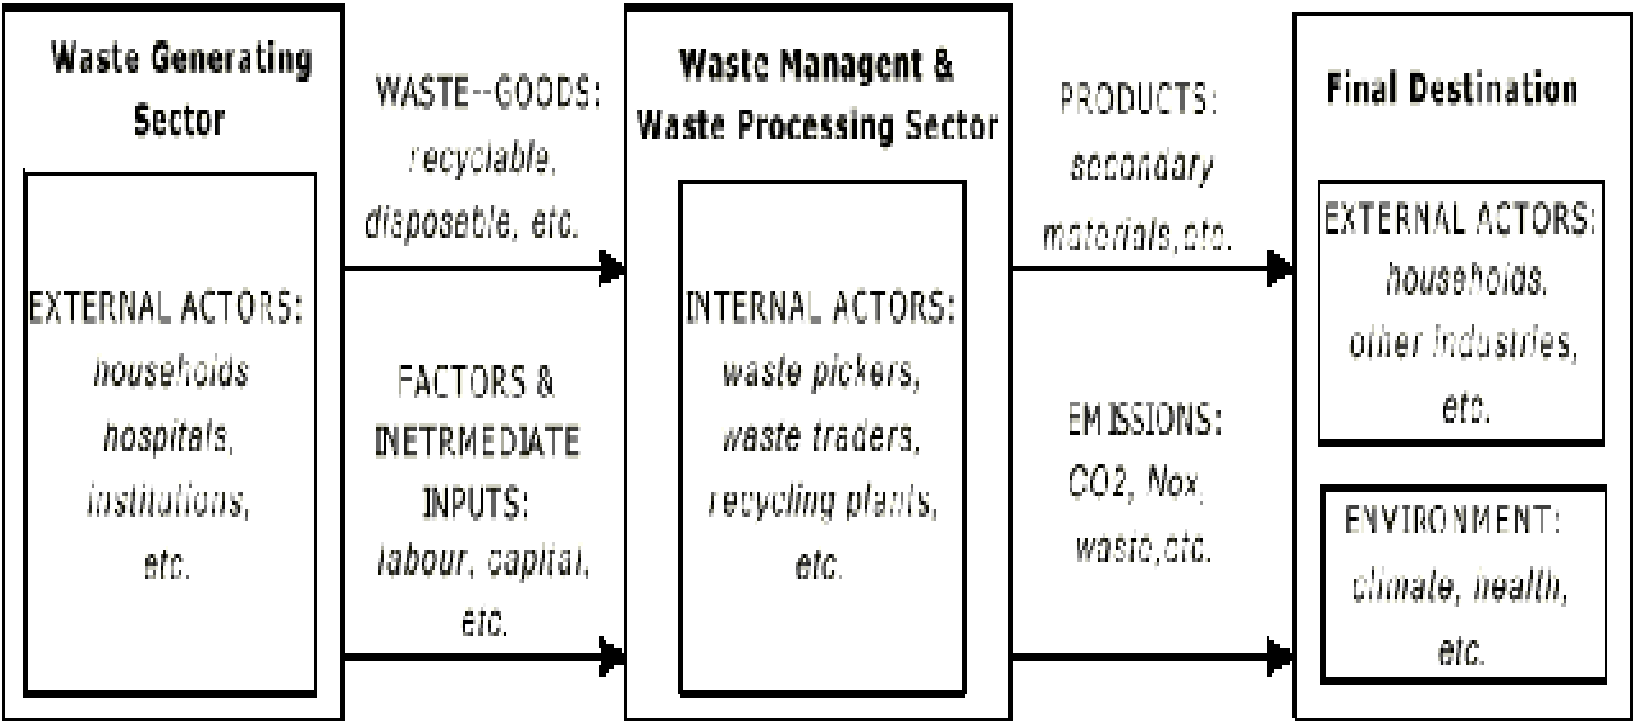

# LOCATION

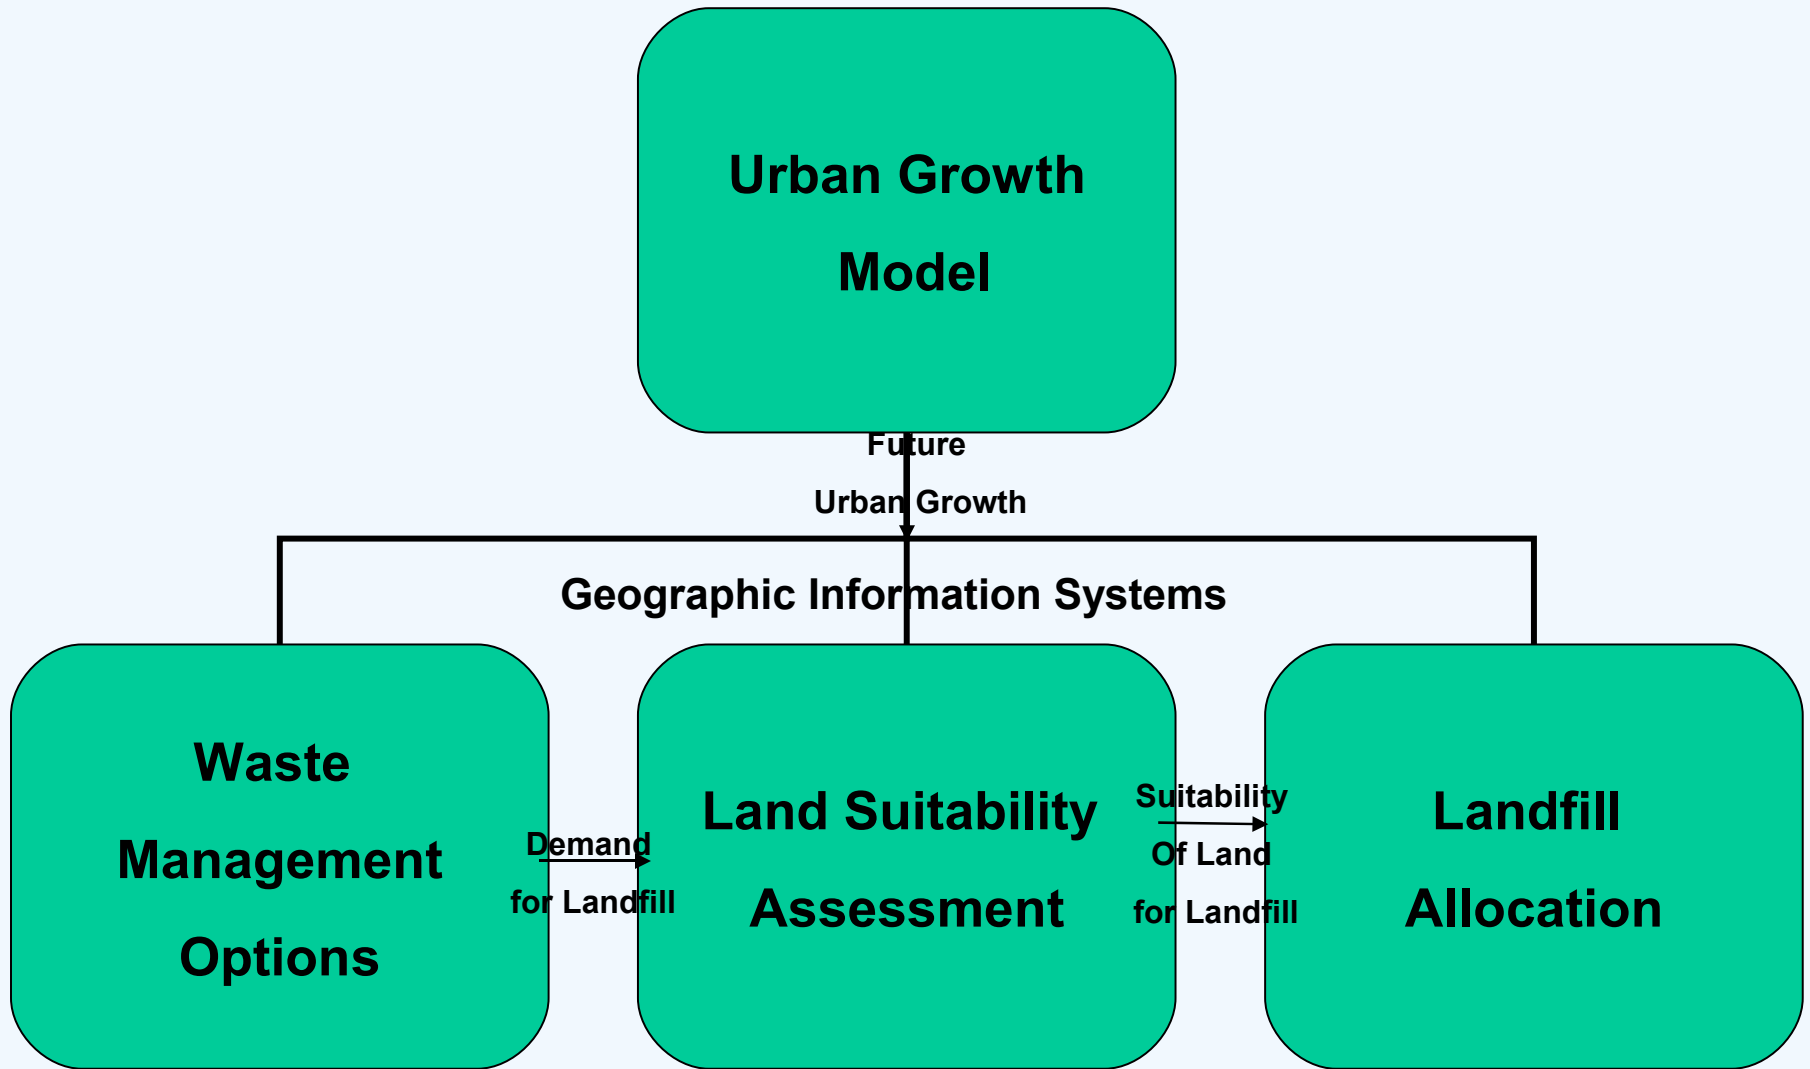

# SELECTION

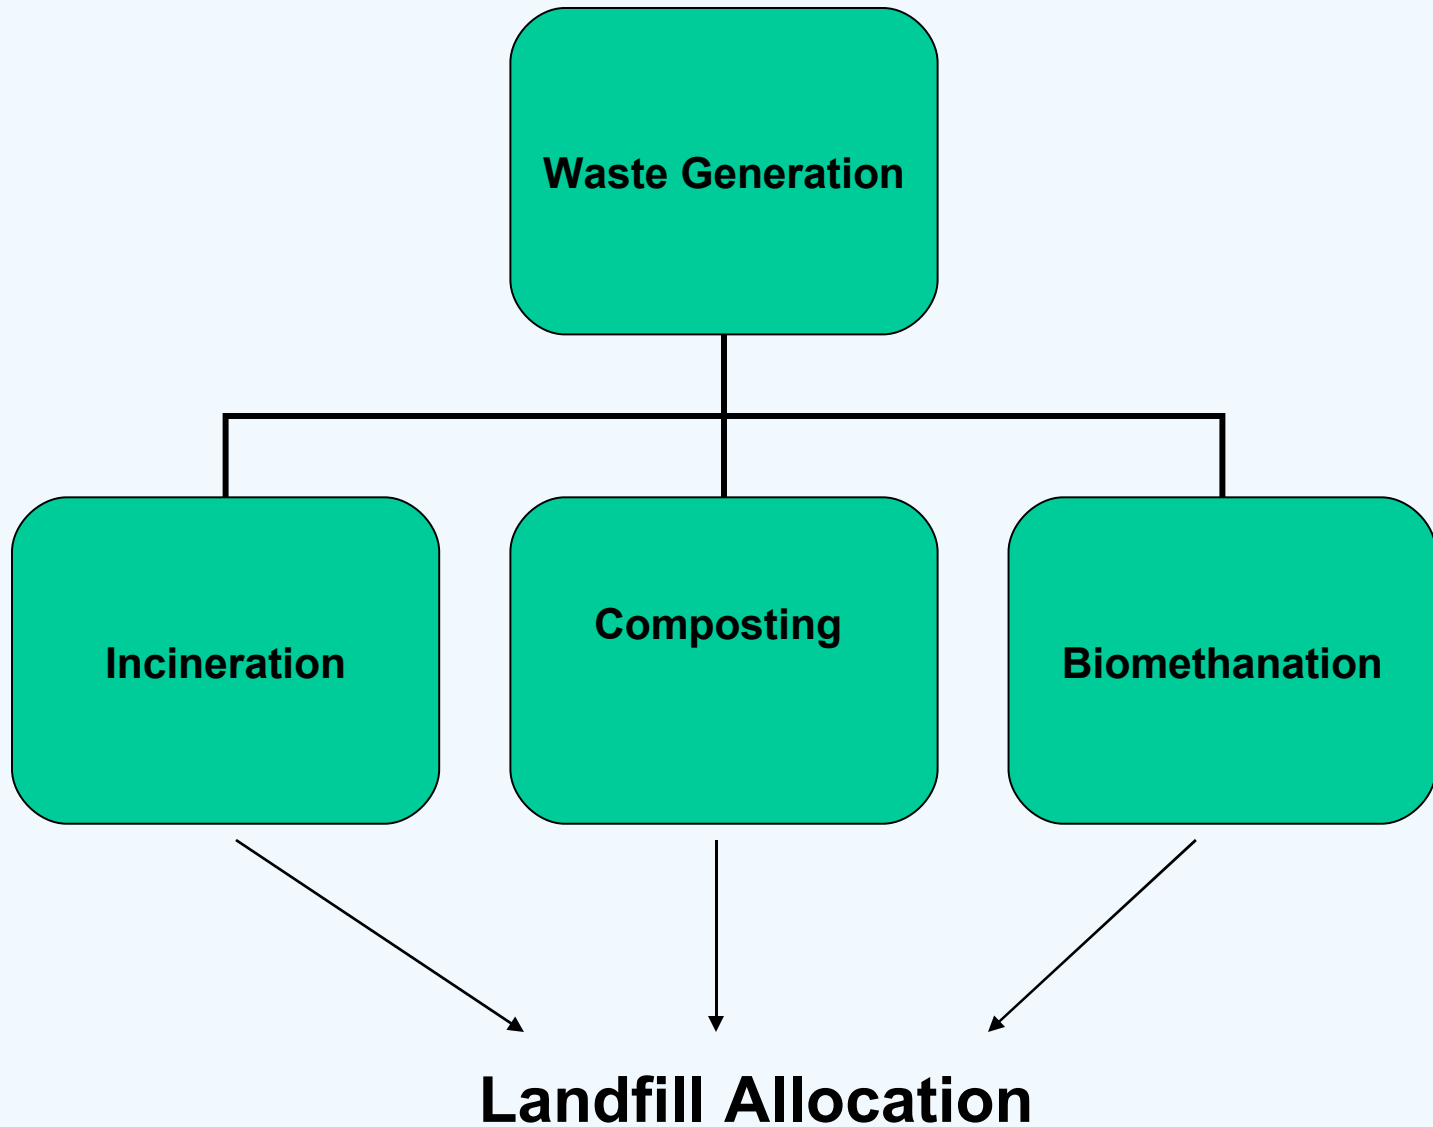

# A SPECIFIC INTEGRATED WASTE ASSESSMENT MODEL

# Dynamic model for Landfill demand and allocation

# Integrated Solid waste Disposal System

**Following Equation Was the Basis of the Above Model:**

**min cost involved = Input cost – Output cost**

$$\min c = \sum_{k \in K} p^k r^k - \sum_{h \in H} \sum_{j \in J} p^{j,h} y^{j,h}$$

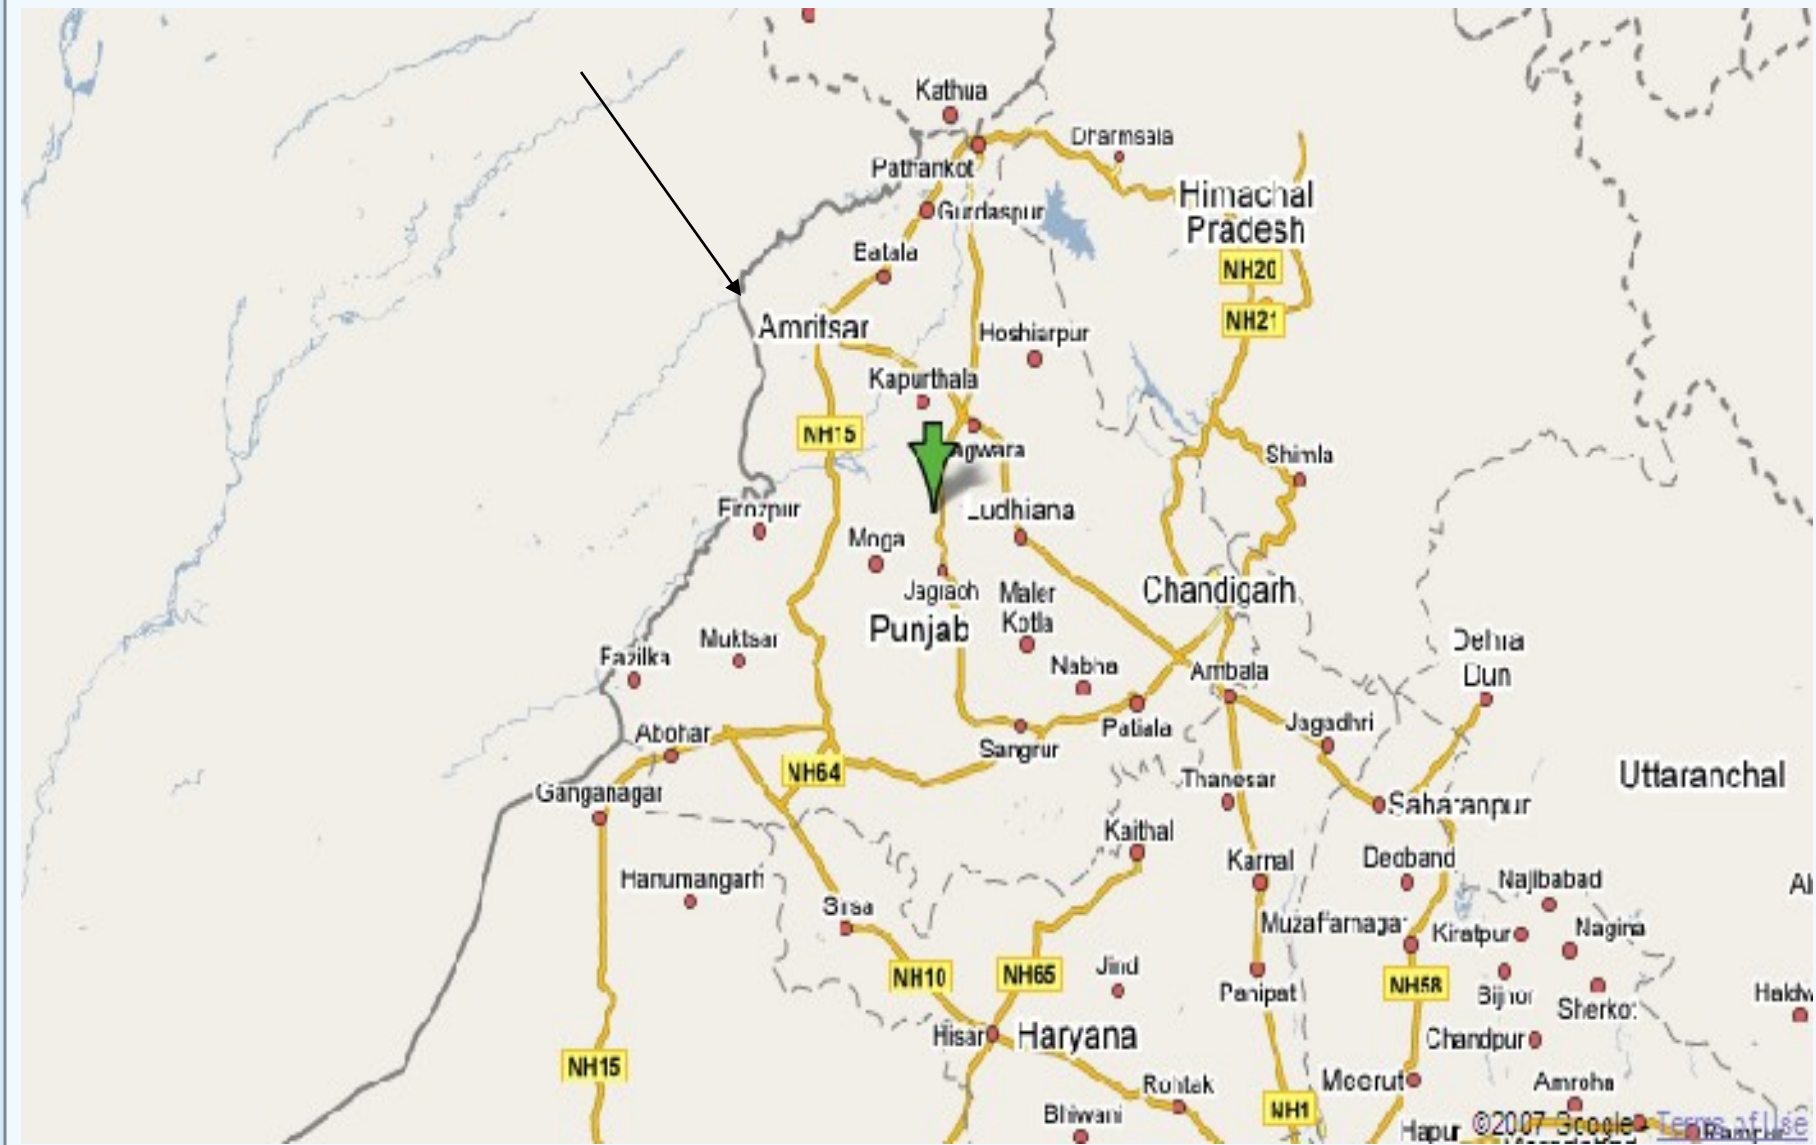

**min c = Input – Output**

**Input = variable cost + interest on capital cost + cost of marketing**

**Output = recovery by sale of electricity or organic manure or both.**

# Municipal Corporation Amritsar

# Detailed physical analysis of MSW of Amritsar

	RESIDENCIAL AREA	INDUSTRIAL AREA	MIXED AREA	AVERAGE
<b>CALORIFIC VALUE(kcal/kg)</b>	<b>1898</b>	<b>1251</b>	<b>1398</b>	<b>1548</b>

# FUNDAMENTAL MATHEMATICAL EQUATIONS INVOLVED IN THE COMPUTER MODEL

**Recovery by heat recovery (incineration technology)**

**Total waste quantity : W tons**

**Net Calorific Value : NCV kcal/kg.**

**Energy recovery potential (kWh) = NCV x W x 1000/860**

$$= 1.16 \times \text{NCV} \times W$$

**Power generation potential (kW) = 1.16 x NCV x W/ 24**

$$= 0.048 \times \text{NCV} \times W$$

**Typical *Waste-to-Wire* Conversion Efficiency = 25%**

**Net power generation potential (kW) = 0.012 x NCV x W**

**If NCV = 1200 kcal/kg., then**

**Net power generation potential (kW) = 14.4 x W**

**Output = 14.4 X W X cost of power per unit**

## Recovery by gas production (biomethanation)

Total waste quantity :  $W$  (tonnes)

Total Organic / Volatile Solids :  $VS = 50\%$ , say

Organic bio-degradable fraction : approx. 66% of VS

$$= 0.33 \times W$$

Typical digestion efficiency = 60%

Typical bio-gas yield:  $B$  ( $m^3$ ) = 0.80  $m^3/kg.$  of VS

destroyed

$$= 0.80 \times 0.60 \times 0.33 \times W \times 1000 = 158.4 \times W$$

**Calorific Value of bio-gas = 5000 kcal/m<sup>3</sup> (typical)**

**Energy recovery potential (kWh) = B x 5000/860 = 921 x W**

**Power generation potential (kW) = 921 x W / 24 = 38.4 x W**

**Typical Conversion Efficiency = 30%**

**Net power generation potential (kW) = 11.5 x W**

**Output = 11.5 X W X cost of power per unit**

## **Recovery by sale of organic manure (composting)**

**Total waste quantity : W (tonnes)**

**Moisture content : 50%**

**Dry mass = 0.5 X W**

**Compostable matter = 50%,**

**Production of organic manure = 0.5 X 0.5 X W**

**Out put = 0.25 X W X cost of manure per unit mass**

# APPLICATION OF MODEL

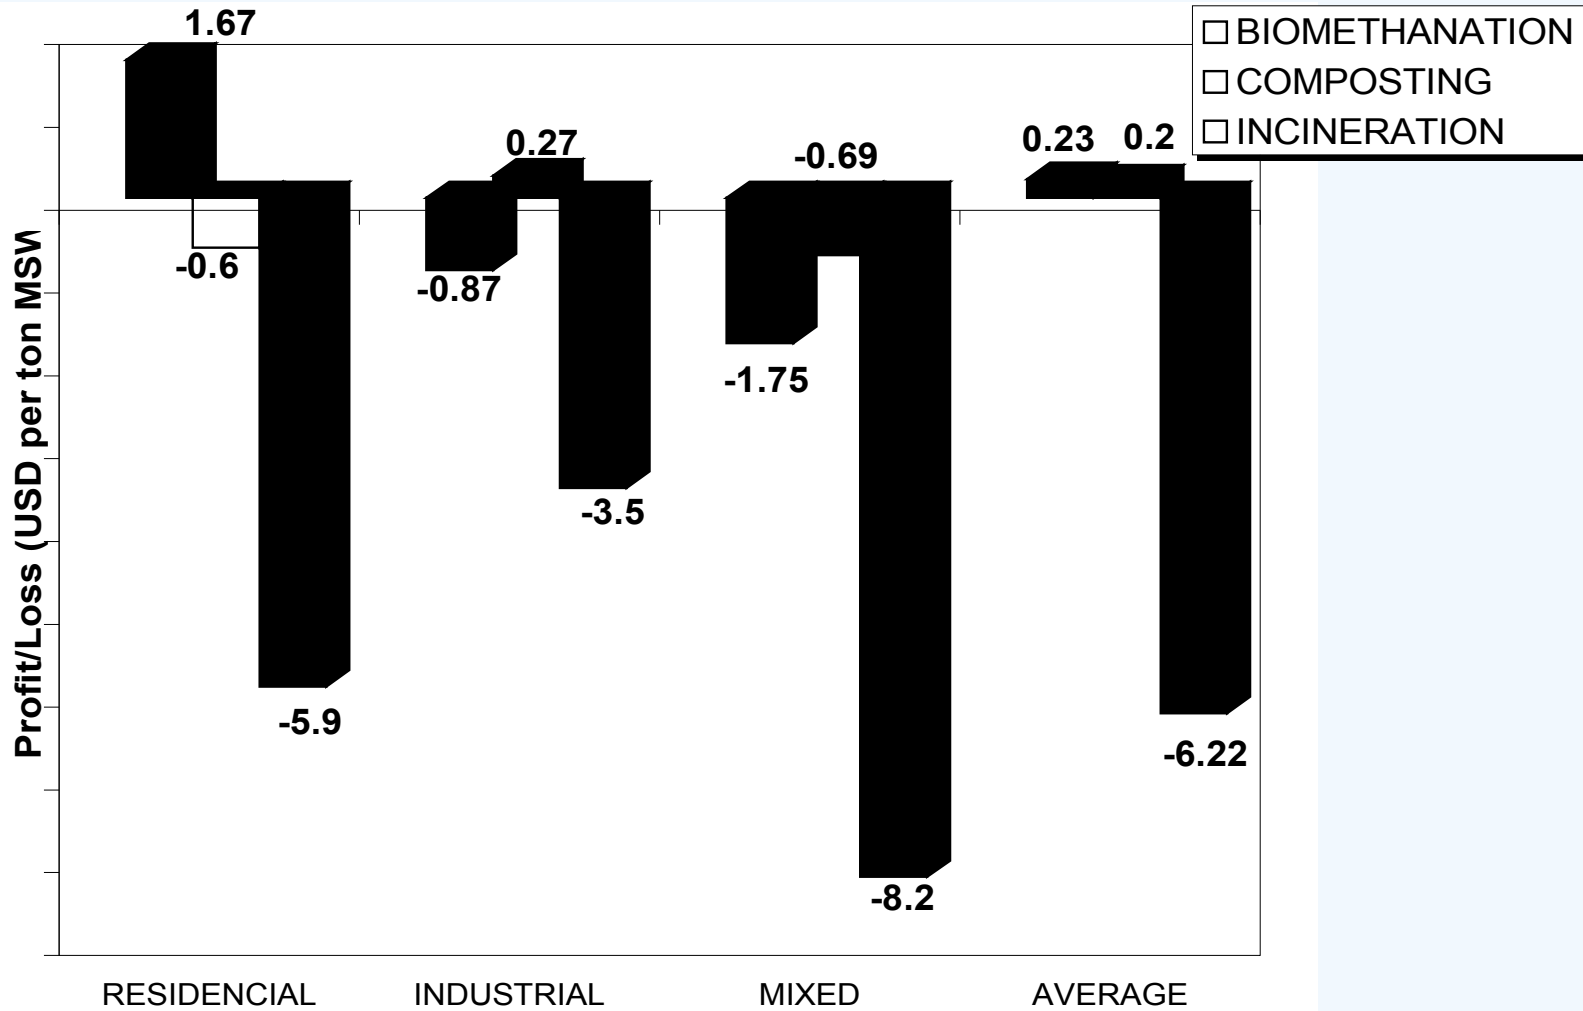

## Economic viability of treatment technologies for average MSW characteristics

*Accepted March 15, 2005*

### Abstract:

Many integrated solid waste management (ISWM) models are available but are of little use to developing countries such as India since they do not take into account typical developing countries municipal solid waste characteristics such as high organic content, poor performance of formal sector control and support, high activity of scavengers and waste pickers, etc. The goal of this study is to create a computer program to determine the least cost treatment and disposal system for a given solid waste management problem. To demonstrate its applicability, the model was applied to the Indian city Amritsar. A typical Indian city like Amritsar generates about 500 ton of MSW/d with 45% moisture content, 30% volatile matter, and calorific value of 1500 kcal/kg. The computer model was run for various technologies. Results show that for Amritsar city, incineration as one of three options of 11.5 million USD (USD) 6.63 is lowest cost option for filling, incineration, and

## Physical characteristics of MSW

<b>Population range (Million)</b>	<b>Paper (%)</b>	<b>Rubber/Leather (%)</b>	<b>Glass (%)</b>	<b>Metals (%)</b>	<b>Compostable (%)</b>	<b>Inert (%)</b>
